"Synopsis Retaining the comprehensive and in-depth approach that cemented the bestselling first edition's place as a standard reference in the field, the 'Handbook of Semiconductor Manufacturing Technology, Second Edition' features new and updated material that keeps it at the vanguard of today's most dynamic and rapidly growing field. Iconic experts Robert Doering and Yoshio Nishi have again assembled a team of the world's leading specialists in every area of semiconductor manufacturing to provide the most reliable, authoritative, and industry-leading information available. This title helps readers to stay current with the latest technologies. In addition to updates to nearly every existing chapter, this edition features five entirely new contributions on: silicon-on-insulator (SOI) materials and devices; supercritical CO<sub>2</sub> in semiconductor cleaning; low-kappa dielectrics; atomic-layer deposition; damascene copper electroplating; and, effects of terrestrial radiation on integrated circuits (ICs). Reflecting rapid progress in many areas, several chapters were heavily revised and updated, and in some cases, rewritten to reflect rapid advances in such areas as interconnect technologies, gate dielectrics, photomask fabrication, IC packaging, and 300 mm wafer fabrication. While no book can be up-to-the-minute with the advances in the semiconductor field, the 'Handbook of Semiconductor Manufacturing Technology' keeps the most important data, methods, tools, and techniques close at hand.
